

UCartify Milestone 3 Demo-

Features Completed

- Primary layout and design
- Navbar appearance
- Navbar linking functionality
- Login/Signup Modal
- HTML and JS sending data For Modal
- Account page design
- HTML and JS sending data for Account Page
- Basic skeletons for Database in MySQL

What Worked In The Demo?

- Everything that we could show at that level of the project worked during our demo. The Home Page and Account pages' HTML worked as intended. The Bootstrap modal for the login/signup also popped up and was correct. We could not show that the Login/Signup inputs worked and were received because we had not finished the Database Front End connection. We also could not show our database because our team member who worked on it was home after school was called to go online.

During Development:

- We made some large design changes during development which slowed our progress. Also the fact that we had barely learned SQL and database connections it was challenging to have significant functionality by the Demo date. During the Demo we had the issue that the team member who was doing what we had so far for our Database had flown home due to COVID-19 to Australia, so we couldn't show what we had for that and couldn't explain what she had done as well. Our TA made no suggestions, but advised us to pick up the pace of development.
